Dosage calculation formulas. If you want to calculate the dose of a medication, you need to use the following equation: dose = weight * dosage.

Read Book Calculating Drug Doses Safely A Handbook For Nurses And Midwives 2e

Weight is the patient's weight, expressed in kg or lb. It is very important that you input an accurate result; Dosage is the prescribed amount of drug in mg per kg of body weight. You can usually find this number on the medication box or on the prescription.

Dosage Calculator - How to Calculate Dosage?

An example would be a prescription for cyclosporin of 10mg/kg. To calculate the child's prescription you need to know an accurate weight for the child in kilograms and then multiply this by the dosage specified. For example, if the child's weight was 12kg then the dose required would be 10mg/kg x 12kg = 120mg.

How to calculate drug doses and infusion rates accurately ...

Calculating Drug Dosages When performing drug calculations, one of the following four methods should be used: Ratio (Rainbow) Method, Proportion Method, Formula Method, or Dimensional Analysis. Each of these methods works as well as the others. However, once the student

Drug Dosage Calculations - Germanna Community College

infusion time (hr) = total volume (mL) ÷ flow rate (mL/hr) total volume (mL) = flow rate (mL/hr) × infusion time (hr) For example, if you must administer 1 L (1,000 mL) of fluid over 4 hours, use the first formula to calculate the flow rate, like so:
