Differential privacy is a system for publicly sharing information about a dataset by describing the patterns of groups within the dataset while withholding information about individuals in the dataset. The idea behind differential privacy is that if the effect of making an arbitrary single substitution in the database is small enough, the query result cannot be used to infer much about any ...

Differential privacy - Wikipedia

Differential Privacy can be defined in terms of the application-specific concept of adjacent databases. Suppose, for adjacent databases where each training dataset contains a set of image-label pairs, we say that two of these sets are adjacent if one image-label pair is present in one training set while absent in the other.
