This requires the use of logarithms. The definition of a logarithm is, if: a b = c. then. log a c = b. When we read the line above, we say “log to the base ‘a’ of ‘c’, is equal to 'b'”. Another way we can think about logarithms is as the inverse of the exponential: for example, if we have a number x, and we put a number, say, 5 to the power of x. 5 x

Like all functions, exponential functions have inverses. The inverse of the exponential is the logarithm, or log, for short. The logarithmic functions are written as which means the same as. In a is called the base, logs can have different bases, however the most common one is base 10.

Like most functions you are likely to come across, the exponential has an inverse function, which is log e x, often written ln x (pronounced 'log x'). In the diagram, e x is the red line, lnx the green line and y = x is the yellow line. Notice that lnx and e x are reflections of one another in the line y = x . Logarithms

The Exponent takes 2 and 3 and gives 8 (2, used 3 times in a multiplication, makes 8) The Logarithm takes 2 and 8 and gives 3 (2 makes 8 when used 3 times in a multiplication) A Logarithm says how many of one number to multiply to get another number. So a logarithm actually gives you the exponent as its answer:
